

# Vehicle Propulsion Systems

## Lecture 8

### Fuel Cell Vehicles

Lars Eriksson  
Professor

Vehicular Systems  
Linköping University

December 7, 2015

1 / 40

## Outline

### Repetition

Fuel Cell Basics  
Fuel Cell Basics  
Fuel Cell Types  
Reformers  
Applications

### Fuel Cell Modeling

### Practical aspects

Examples of Components in a Technology Demonstrator

2 / 40

## Deterministic Dynamic Programming – Basic algorithm

$$J(x_0) = g_N(x_N) + \sum_{k=0}^{N-1} g_k(x_k, u_k)$$

$$x_{k+1} = f_k(x_k, u_k)$$

Algorithm idea:

Start at the end and proceed backward in time to evaluate the optimal cost-to-go and the corresponding control signal

3 / 40

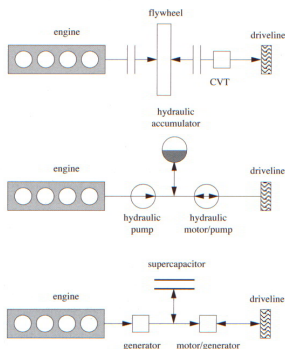

## Deterministic Dynamic Programming – Basic Algorithm

Graphical illustration of the solution procedure

5 / 40

## Examples of Short Term Storage Systems

6 / 40

## Pneumatic Hybrid Engine System

7 / 40

## Heuristic Control Approaches

- Parallel hybrid vehicle (electric assist)

- Determine control output as function of some selected state variables:  
vehicle speed, engine speed, state of charge, power demand, motor speed, temperature, vehicle acceleration, torque demand

8 / 40

## ECMS – Equivalent Consumption Minimization Strategy

- $\mu_0$  depends on the (soft) constraint

$$\mu_0 = \frac{\partial}{\partial q(t_f)} \phi(q(t_f)) = \text{/special case/} = -w$$

- Different efficiencies

$$\mu_0 = \frac{\partial}{\partial q(t_f)} \phi(q(t_f)) = \begin{cases} -w_{dis}, & q(t_f) > q(0) \\ -w_{chg}, & q(t_f) < q(0) \end{cases}$$

- Introduce equivalence factor (scaling) by studying battery and fuel power

$$s(t) = -\mu(t) \frac{H_{LHV}}{V_b Q_{max}}$$

ECMS – Equivalent Consumption Minimization Strategy

9 / 40

## Determining Equivalence Factors II

- ▶ Collecting battery and fuel energy data from test runs with constant  $u$  gives a graph

- ▶ Slopes determine  $s_{dis}$  and  $s_{chg}$

10/40

## Outline

### Repetition

### Fuel Cell Basics

- Fuel Cell Basics
- Fuel Cell Types
- Reformers
- Applications

### Fuel Cell Modeling

### Practical aspects

Examples of Components in a Technology Demonstrator

11/40

## Fuel Cell Basic Principles

- ▶ Convert fuel directly to electrical energy
- ▶ Let an ion pass from an anode to a cathode
- ▶ Take out electrical work from the electrons

12/40

## Fuel Cell Stack

- ▶ The voltage out from one cell is just below 1 V.
- ▶ Fuel cells are stacked.

13/40

## Components in a Fuel Cell Stack

14/40

## Overview of Different Fuel Cell Technologies

15/40

## AFC – Alkaline Fuel cell

- ▶ Among the most efficient fuel cells 70%
- ▶ Low temperature  $65-220^\circ C$ 
  - ▶ Quick start, fast dynamics
  - ▶ No co-generation
- ▶ Sensitive to poisoning

16/40

## PEMFC – Proton Exchange Membrane Fuel Cell

Advantages:

- ▶ Relatively high power-density characteristic
- ▶ Operating temperature, less than  $100^\circ C$ 
  - Allows rapid start-up
- ▶ Good transient response, i.e. change power
  - Top candidate for automotive applications
- ▶ Other advantages relate to the electrolyte being a solid material, compared to a liquid

Disadvantages:

- ▶ of the PEMFC for some applications operating: temperature is low
- ▶ The electrolyte is required to be saturated with water to operate optimally.
  - Careful control of the moisture of the anode and cathode streams is important

17/40

## The Other Types of H<sub>2</sub> Fuel Cells

- Other fuel cell types are
  - PAFC – Phosphoric Acid Fuel Cell 175°C
  - MCFC – Molten Carbonate Fuel Cell 650°C
  - SOFC – Solid Oxide Fuel Cells 1000°C
- Hotter cells, slower, more difficult to control
- Power generation through co-generation

18 / 40

## Hydrogen Fuel Storage

- Hydrogen storage is problematic - Challenging task.
- Some examples of different options.
  - Compressed Hydrogen storage
  - Liquid phase – Cryogenic storage, -253°C
  - Metal hydride
  - Sodium borohydride  $\text{NaBH}_4$

19 / 40

## Comparison of H<sub>2</sub> Fuel Cells – US DOE

Fuel Cell Type	Common Electrolyte	Operating Temperature	Typical Stack Size	Efficiency	Applications	Advantages	Disadvantages
Polymer Electrolyte Membrane (PEM)	Purified sulfuric acid	50-100°C 122-212°F typically 80°C	<1kW-100kW	60% transportation 30% stationary	<ul style="list-style-type: none"> <li>Backup power</li> <li>Portable power</li> <li>Distributed generation</li> <li>Transportation</li> <li>Specialty vehicles</li> </ul>	<ul style="list-style-type: none"> <li>Solid electrolyte reduces corrosion &amp; electrolyte management problems</li> <li>Low temperature</li> <li>Quick start-up</li> </ul>	<ul style="list-style-type: none"> <li>Expensive catalysts</li> <li>Sensitive to fuel impurities</li> <li>Low temperature waste heat</li> </ul>
Alkaline (AFC)	Aqueous solution of potassium hydroxide soaked in a matrix	90-100°C 194-212°F	10-100 kW	60%	<ul style="list-style-type: none"> <li>Military</li> <li>Space</li> </ul>	<ul style="list-style-type: none"> <li>Cathode reaction faster in alkaline electrolyte, leads to high performance</li> <li>Low cost components</li> </ul>	<ul style="list-style-type: none"> <li>Sensitive to CO<sub>2</sub> in fuel and air</li> <li>Electrolyte management</li> </ul>
Phosphoric Acid (PAFC)	Phosphoric acid soaked in a matrix	150-200°C 302-392°F	400 kW 100 kW module	40%	<ul style="list-style-type: none"> <li>Distributed generation</li> </ul>	<ul style="list-style-type: none"> <li>Higher temperature enables CHP</li> <li>Increased tolerance to fuel impurities</li> </ul>	<ul style="list-style-type: none"> <li>Pl catalyst</li> <li>Long start up time</li> <li>Low current and power</li> </ul>
Molten Carbonate (MCFC)	Solution of lithium, sodium, and/or potassium carbonates, soaked in a matrix	600-700°C 1112-1292°F	300 kW-3 MW 300 kW module	45-50%	<ul style="list-style-type: none"> <li>Electric utility</li> <li>Distributed generation</li> </ul>	<ul style="list-style-type: none"> <li>High efficiency</li> <li>Fuel flexibility</li> <li>Can use a variety of catalysts</li> <li>Suitable for CHP</li> </ul>	<ul style="list-style-type: none"> <li>High temperature corrosion and breakdown of cell components</li> <li>Long start up time</li> <li>Low power density</li> </ul>
Solid Oxide (SOFC)	Yttria stabilized zirconia	700-1000°C 1292-1832°F	1kW-2 MW	60%	<ul style="list-style-type: none"> <li>Auxiliary power</li> <li>Electric utility</li> <li>Distributed generation</li> </ul>	<ul style="list-style-type: none"> <li>High efficiency</li> <li>Fuel flexibility</li> <li>Can use a variety of catalysts</li> <li>Solid electrolyte</li> <li>Suitable for CHP &amp; CHHP</li> <li>Hybrid/IST cycle</li> </ul>	<ul style="list-style-type: none"> <li>High temperature corrosion and breakdown of cell components</li> <li>High temperature operation requires long start up time and limits</li> </ul>

20 / 40

## DMFC – Direct Methanol Fuel Cell

- Basic operation
  - Anode Reaction:  $\text{CH}_3\text{OH} + \text{H}_2\text{O} \Rightarrow \text{CO}_2 + 6\text{H}^+ + 6\text{e}^-$
  - Cathode Reaction:  $3/2\text{O}_2 + 6\text{H}^+ + 6\text{e}^- \Rightarrow 3\text{H}_2\text{O}$
  - Overall Cell Reaction:  $\text{CH}_3\text{OH} + 3/2\text{O}_2 \Rightarrow \text{CO}_2 + 2\text{H}_2\text{O}$
- Main advantage, does not need pure Hydrogen.
- Applications outside automotive –battery replacements –small light weight
- Low temperature
- Methanol toxicity is a problem

21 / 40

## Reformers

- Fuel cells need hydrogen – Generate it on-board –Steam reforming of methanol.

22 / 40

## Fuel Cell Applications in USA – US DOE

**Fuel Cells for Stationary Power, Auxiliary Power, and Specialty Vehicles**

The largest markets for fuel cells today are in stationary power, portable power, auxiliary power units, and forklifts.

**~75,000** fuel cells have been shipped worldwide.

**>15,000** fuel cells shipped in 2009

Fuel cells can be a cost-competitive option for critical-load facilities, backup power, and forklifts.

**Fuel Cells for Transportation**

In the U.S., there are currently:

- > 200 fuel cell vehicles
- ~ 20 active fuel cell buses
- ~ 60 fueling stations

Sept. 2009: Auto manufacturers from around the world signed a letter of understanding supporting fuel cell vehicles in anticipation of widespread commercialization, beginning in 2015.

**Production & Delivery of Hydrogen**

In the U.S., there are currently:

- ~9 million metric tons** of H<sub>2</sub> produced annually
- > 1200 miles** of H<sub>2</sub> pipelines

Source: US DOE 09/2010

23 / 40

## Outline

### Repetition

### Fuel Cell Basics

- Fuel Cell Basics
- Fuel Cell Types
- Reformers
- Applications

### Fuel Cell Modeling

### Practical aspects

- Examples of Components in a Technology Demonstrator

## Quasistatic Modeling of a Fuel Cell

- Causality diagram

- Power amplifier (Current controller)
- Fuel amplifier (Fuel controller)
- Standard modeling approach

24 / 40

25 / 40

## Fuel Cell Thermodynamics

- Starting point reaction equation

- Open system energy – Enthalpy H

$$H = U + pV$$

- Available (reversible) energy – Gibbs free energy G

$$G = H - TS$$

- Open circuit cell voltages

$$U_{rev} = -\frac{\Delta G}{n_e F}, \quad U_{id} = -\frac{\Delta H}{n_e F}, \quad U_{rev} = \eta_{id} U_{id}$$

F – Faradays constant ( $F = q N_0$ )

- Heat losses under load – Cooling system

$$P_l = I_{fc}(t) (U_{id} - U_{fc}(t))$$

26 / 40

## Fuel Cell Performance – Polarization curve

- Polarization curve of a fuel cell

Relating current density  $i_{fc}(t) = I_{fc}(t)/A_{fc}$ , and cell voltage  $U_{fc}(t)$

Curve for one operating condition

- Fundamentally different compared to combustion engine/electrical motor
- Excellent part load behavior – When considering only the cell

27 / 40

## Single Cell Modeling

- Fuel cell voltage

$$U_{fc}(t) = U_{rev}(t) - U_{act}(t) - U_{ohm}(t) - U_{conc}(t)$$

- Activation energy – Get the reactions going  
Semi-empirical Tafel equation

$$U_{act}(t) = c_0 + c_1 \ln(i_{fc}(t)), \text{ or } U_{act}(t) = \dots$$

- Ohmic – Resistance to flow of ions in the cell

$$U_{ohm}(t) = i_{fc}(t) \tilde{R}_{fc}$$

- Concentration, change in concentration of the reactants at the electrodes

$$U_{conc}(t) = c_2 \cdot i_{fc}(t)^{c_3}, \text{ or } U_{conc}(t) = \dots$$

28 / 40

## Fuel Cell System Modeling

- A complete fuel cell system

- Power at the stack with N cells

$$P_{st}(t) = I_{fc}(t) U_{fc}(t) N$$

29 / 40

## Fuel Cell System Modeling

- Describe all subsystems with models

$$P_2(t) = P_{st}(t) - P_{aux}(t)$$

$$P_{aux} = P_0 + P_{em}(t) + P_{ahp}(t) + p_{hp}(t) + P_{cl}(t) + p_{cl}(t)$$

em – electric motor, ahp – humidifier pump, hp – hydrogen recirculation pump, cl – coolant pump, cf – cooling fan.

- Submodels for:  
Hydrogen circuit, air circuit, water circuit, and coolant circuit

30 / 40
