

Vehicle Propulsion Systems

Lecture 6

Non Electric Hybrid Propulsion Systems

Lars Eriksson
Associate Professor (Docent)

Vehicular Systems
Linköping University

November 11, 2011

Outline

Repetition

Short Term Storage

Hybrid-Inertial Propulsion Systems

- Basic principles
- Design principles
- Modeling
- Continuously Variable Transmission

Hybrid-Hydraulic Propulsion Systems

- Basics
- Modeling

Hydraulic Pumps and Motors

Pneumatic Hybrid Engine Systems

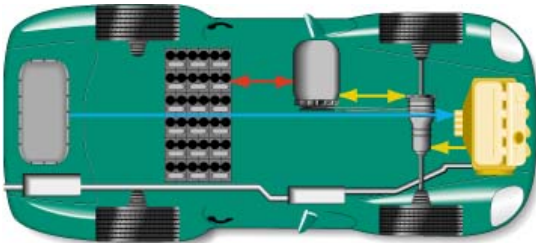

Case studies

2 / 48

3 / 48

Hybrid Electrical Vehicles – Parallel

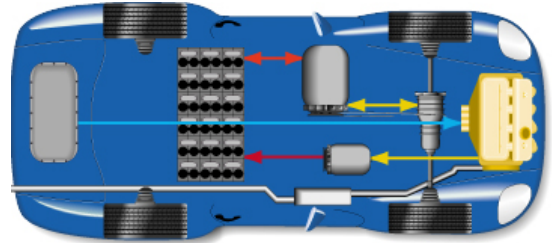

- Two parallel energy paths
- One state in QSS framework, state of charge

4 / 48

Hybrid Electrical Vehicles – Serial

- Two paths working in parallel
- Decoupled through the battery
- Two states in QSS framework, state of charge & Engine speed

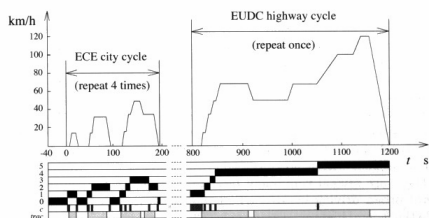

5 / 48

Optimization, Optimal Control, Dynamic Programming

What gear ratios give the lowest fuel consumption for a given driving cycle?

– Problem presented in appendix 8.1

Problem characteristics

- Countable number of free variables, $i_{g,j}$, $j \in [1, 5]$
- A “computable” cost, $m_f(\dots)$
- A “computable” set of constraints, model and cycle
- The formulated problem

$$\begin{aligned} \min_{i_{g,j}, j \in [1,5]} \quad & m_f(i_{g,1}, i_{g,2}, i_{g,3}, i_{g,4}, i_{g,5}) \\ \text{s.t.} \quad & \text{model and cycle is fulfilled} \end{aligned}$$

6 / 48

7 / 48

Optimal Control – Problem Motivation

Car with gas pedal $u(t)$ as control input:

How to drive from A to B on a given time with minimum fuel consumption?

- Infinite dimensional decision variable $u(t)$.
- Cost function $\int_0^{t_f} \dot{m}_f(t) dt$
- Constraints:
 - Model of the car (the vehicle motion equation)

$$\begin{aligned} m_v \frac{d}{dt} v(t) &= F_t(v(t), u(t)) - (F_a(v(t)) + F_r(v(t)) + F_g(x(t))) \\ \frac{d}{dt} x(t) &= v(t) \\ \dot{m}_f &= f(v(t), u(t)) \end{aligned}$$

- Starting point $x(0) = A$
- End point $x(t_f) = B$
- Speed limits $v(t) \leq g(x(t))$
- Limited control action $0 \leq u(t) \leq 1$

General problem formulation

- Performance index

$$J(u) = \phi(x(t_b), t_b) + \int_{t_a}^{t_b} L(x(t), u(t), t) dt$$

- System model (constraints)

$$\frac{d}{dt} x = f(x(t), u(t), t), x(t_a) = x_a$$

- State and control constraints

$$u(t) \in U(t)$$

$$x(t) \in X(t)$$

8 / 48

9 / 48

Dynamic programming – Problem Formulation

- Optimal control problem

$$\min J(u) = \phi(x(t_b), t_b) + \int_{t_a}^{t_b} L(x(t), u(t), t) dt$$

$$\text{s.t. } \frac{d}{dt} x = f(x(t), u(t), t)$$

$$x(t_a) = x_a$$

$$u(t) \in U(t)$$

$$x(t) \in X(t)$$

- $x(t)$, $u(t)$ functions on $t \in [t_a, t_b]$
- Search an approximation to the solution by discretizing
 - the state space $x(t)$
 - and maybe the control signal $u(t)$
 in both amplitude and time.
- The result is a combinatorial (network) problem

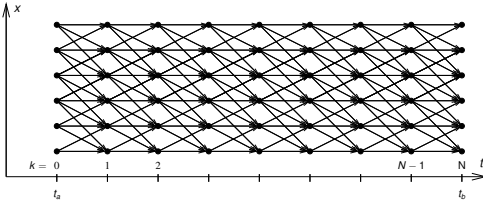

Deterministic Dynamic Programming – Basic algorithm

$$J(x_0) = g_N(x_N) + \sum_{k=0}^{N-1} g_k(x_k, u_k)$$

$$x_{k+1} = f_k(x_k, u_k)$$

Algorithm idea:

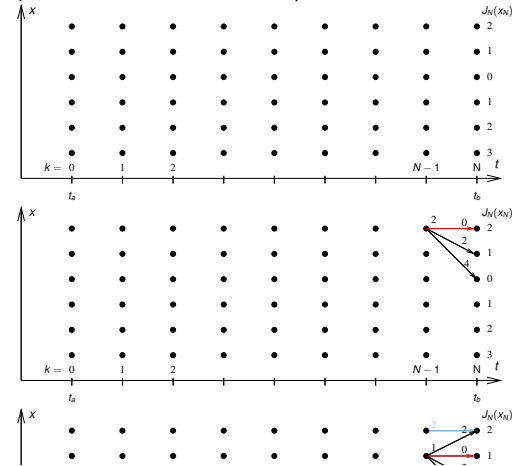

Start at the end and proceed backwards in time to evaluate the optimal cost-to-go and the corresponding control signal.

10 / 48

Deterministic Dynamic Programming – Basic Algorithm

Graphical illustration of the solution procedure

11 / 48

Arc Cost Calculations

There are two ways for calculating the arc costs

- Calculate the exact control signal and cost for each arc.
 - Quasi-static approach
- Make a grid over the control signal and interpolate the cost for each arc.
 - Forward calculation approach

Matlab implementation – it is important to utilize matrix calculations

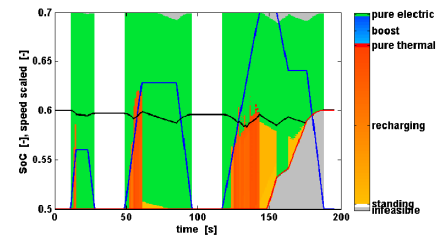

- Calculate the whole bundle of arcs in one step
- Add boundary and constraint checks

2D and 3D grid examples on whiteboard

12 / 48

Parallel Hybrid Example

- Fuel-optimal torque split factor $u(SOC, t) = \frac{T_{g-motor}}{T_{gearbox}}$
- ECE cycle
- Constraints $SOC(t = t_f) \geq 0.6$, $SOC \in [0.5, 0.7]$

Pneumatic Hybrid Engine Systems

Case studies

14 / 48

Examples of Short Term Storage Systems

15 / 48

Short Term Storage – F1

FIA allowed the usage of 60 kW, KERS (Kinetic Energy Recovery System) in F1 in 2009.

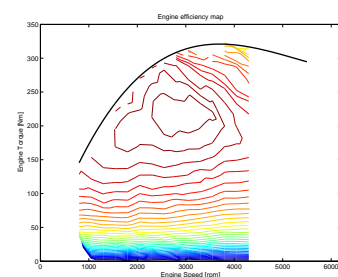

Technologies:

- Flywheel
- Batteries
- Super-Caps

16 / 48

Basic Principles for Hybrid Systems

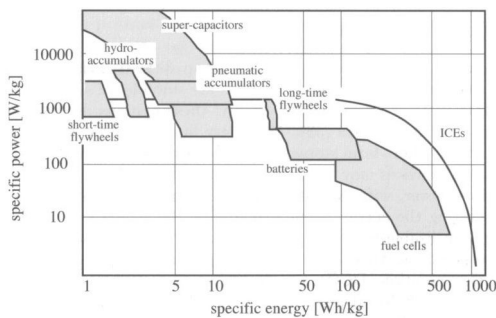

- Kinetic energy recovery
- Use “best” points – Duty cycle.
 - Run engine (fuel converter) at its optimal point.
 - Shut-off the engine.

17 / 48

Power and Energy Densities

Asymptotic power and energy density – The Principle

19 / 48

Causality for a hybrid-inertial propulsion system

20 / 48

Flywheel accumulator

► Energy stored ($\Theta_f = J_f$):

$$E_f = \frac{1}{2} \Theta_f \omega_f^2$$

► Wheel inertia

$$\Theta_f = \rho b \int_{Area} r^2 2\pi r dr = \dots = \frac{\pi}{2} \rho \frac{d^4}{16} (1 - q^4)$$

21 / 48

Flywheel accumulator – Design principle

► Energy stored (SOC):

$$E_f = \frac{1}{2} \Theta_f \omega_f^2$$

► Wheel inertia

$$\Theta_f = \rho b \int_{Area} r^2 2\pi r dr = \dots = \frac{\pi}{2} \rho \frac{d^4}{16} (1 - q^4)$$

► Wheel Mass

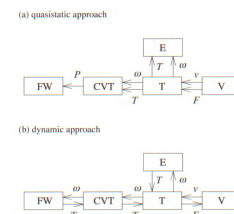

$$m_f = \pi \rho b d^2 (1 - q^2)$$

► Energy to mass ratio

$$\frac{E_f}{m_f} = \frac{d^2}{16} (1 + q^2) \omega_f^2 = \frac{v^2}{4} (1 + q^2)$$

22 / 48

Quasistatic Modeling of FW Accumulators

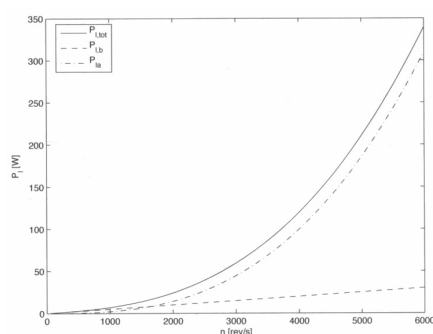

Flywheel speed (SOC) $P_2(t)$ – power out, $P_1(t)$ – power loss

$$\Theta_f \omega_2(t) \frac{d}{dt} \omega_2(t) = -P_2(t) - P_1(t)$$

23 / 48

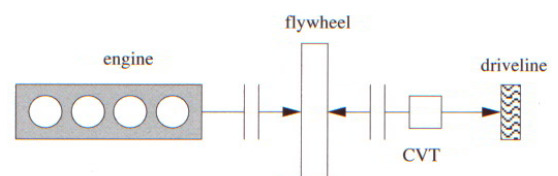

Power losses as a function of speed

Air resistance and bearing losses

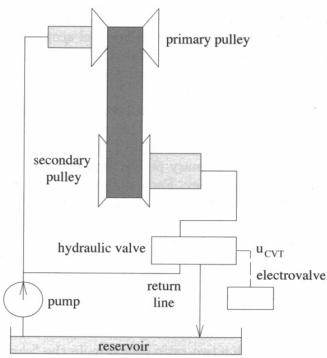

24 / 48

Continuously Variable Transmission (CVT)

25 / 48

CVT Principle

26 / 48

CVT Modeling

- Transmission (gear) ratio ν , speeds and transmitted torques

$$\omega_1(t) = \nu(t) \omega_2(t)$$

$$T_{H1}(t) = \nu(T_{H2}(t) - T_{I1}(t))$$

- Newtons second law for the two pulleys

$$\Theta_1 \frac{d}{dt} \omega_1(t) = T_1(t) - T_{H1}(t)$$

$$\Theta_2 \frac{d}{dt} \omega_2(t) = T_2(t) - T_{H2}(t)$$

- System of equations give

$$T_1(t) = T_{I1}(t) + \frac{T_2(t)}{\nu(t)} + \frac{\Theta_{CVT}(t)}{\nu(t)} \frac{d}{dt} \omega_2(t) + \Theta_1 \frac{d}{dt} \nu(t) \omega_2(t)$$

27 / 48

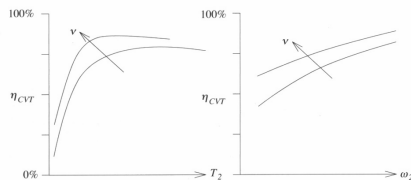

CVT Modeling

- Transmission (gear) ratio ν , speeds and transmitted torques

$$\omega_1(t) = \nu(t) \omega_2(t)$$

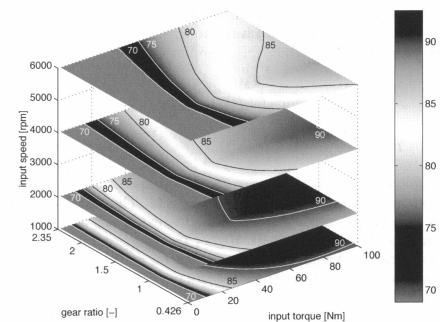

$$T_{H1}(t) = \nu(T_{H2}(t) - T_{I1}(t))$$

- An alternative to model the losses, is to use an efficiency definition.

28 / 48

Efficiencies for a Push-Belt CVT

Examples of Short Term Storage Systems

30 / 48

31 / 48

Causality for a hybrid-hydraulic propulsion system

32 / 48

Modeling of a Hydraulic Accumulator

Modeling principle

–Energy balance

$$m_g c_v \frac{d}{dt} \theta_g(t) = -p \frac{d}{dt} V_g(t) - h A_w (\theta_g(t) - \theta_l)$$

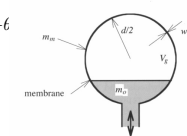

–Mass balance

(=volume for incompressible fluid)

$$\frac{d}{dt} V_g(t) = Q_2(t)$$

–Ideal gas law

$$p_g(t) = \frac{m_g R_g \theta_g(t)}{V_g(t)}$$

Power generation

$$P_2(t) = p_2(t) Q_2(t)$$

33 / 48

Model Simplification

Simplifications made in thermodynamic equations to get a simple state equation.

- ▶ Assuming steady state conditions.
 - Eliminating θ_g and the volume change gives

$$p_2(t) = \frac{h A_w \theta_w m_g R_g}{V_g(t) h A_w + m_g R_g Q_2(t)}$$

- ▶ Combining this with the power output gives

$$Q_2(t) = \frac{V_g(t)}{m_g} \frac{h A_w P_2(t)}{R_g \theta_w h A_w - R_g P_2(t)}$$

- ▶ Integrating $Q_2(t)$ gives V_g as the state in the model.
- ▶ Modeling of the hydraulic systems efficiency, see the book.
- ▶ **A detail for the assignment**
 - This simplification can give problems in the simulation if parameter values are off. (Division by zero.)

35/48

Hydraulic Pumps

36/48

Modeling of Hydraulic Motors

- ▶ Efficiency modeling

$$P_1(t) = \frac{P_2(t)}{\eta_{hm}(\omega_2(t), T_2(t))}, \quad P_2(t) > 0$$

$$P_1(t) = P_2(t) \eta_{hm}(\omega_2(t), -|T_2(t)|), \quad P_2(t) < 0$$

- ▶ Willans line modeling, describing the loss

$$P_1(t) = \frac{P_2(t) + P_0}{e}$$

- ▶ Physical modeling
 - Wilson's approach provided in the book.

Case Study 3: ICE and Flywheel Powertrain

- Control of a ICE and Flywheel Powertrain
- Switching on and off engine

Problem description

For each constant vehicle speed find the optimal limits for starting and stopping the engine
–Minimize fuel consumption

–Solved through parameter optimization \Rightarrow Map used for control

Case Study 8: Hybrid Pneumatic Engine

- Local optimization of the engine thermodynamic cycle
- Different modes to select between
- Dynamic programming of the mode selection
