

# Vehicle Propulsion Systems

## Lecture 7

### Non Electric Hybrid Propulsion Systems

Lars Eriksson  
Associate Professor (Docent)

Vehicular Systems  
Linköping University

December 1, 2014

## Outline

### Repetition

### Short Term Storage

### Hybrid-Inertial Propulsion Systems

- Basic principles
- Design principles
- Modeling
- Continuously Variable Transmission

### Hybrid-Hydraulic Propulsion Systems

- Basics
- Modeling

### Hydraulic Pumps and Motors

### Pneumatic Hybrid Engine Systems

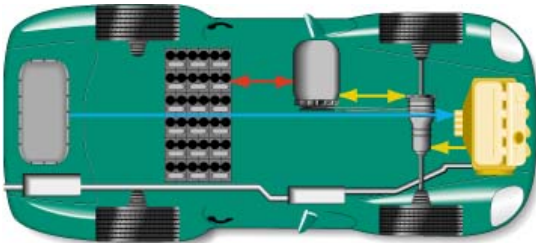

### Case studies

2 / 48

3 / 48

## Hybrid Electrical Vehicles – Parallel

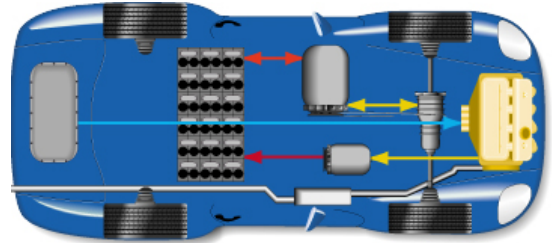

- Two parallel energy paths
- One state in QSS framework, state of charge

4 / 48

## Hybrid Electrical Vehicles – Serial

- Two paths working in parallel
- Decoupled through the battery
- Two states in QSS framework, state of charge & Engine speed

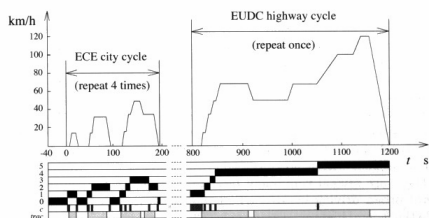

5 / 48

## Optimization, Optimal Control, Dynamic Programming

What gear ratios give the lowest fuel consumption for a given driving cycle?

– Problem presented in appendix 8.1

Problem characteristics

- Countable number of free variables,  $i_{g,j}$ ,  $j \in [1, 5]$
- A “computable” cost,  $m_f(\dots)$
- A “computable” set of constraints, model and cycle
- The formulated problem

$$\begin{aligned} \min_{i_{g,j}, j \in [1,5]} \quad & m_f(i_{g,1}, i_{g,2}, i_{g,3}, i_{g,4}, i_{g,5}) \\ \text{s.t.} \quad & \text{model and cycle is fulfilled} \end{aligned}$$

6 / 48

7 / 48

## Optimal Control – Problem Motivation

Car with gas pedal  $u(t)$  as control input:

How to drive from A to B on a given time with minimum fuel consumption?

- Infinite dimensional decision variable  $u(t)$ .
- Cost function  $\int_0^{t_f} \dot{m}_f(t) dt$
- Constraints:
  - Model of the car (the vehicle motion equation)

$$\begin{aligned} m_v \frac{d}{dt} v(t) &= F_t(v(t), u(t)) - (F_a(v(t)) + F_r(v(t)) + F_g(x(t))) \\ \frac{d}{dt} x(t) &= v(t) \\ \dot{m}_f &= f(v(t), u(t)) \end{aligned}$$

- Starting point  $x(0) = A$
- End point  $x(t_f) = B$
- Speed limits  $v(t) \leq g(x(t))$
- Limited control action  $0 \leq u(t) \leq 1$

## General problem formulation

- Performance index

$$J(u) = \phi(x(t_b), t_b) + \int_{t_a}^{t_b} L(x(t), u(t), t) dt$$

- System model (constraints)

$$\frac{d}{dt} x = f(x(t), u(t), t), x(t_a) = x_a$$

- State and control constraints

$$u(t) \in U(t)$$

$$x(t) \in X(t)$$

8 / 48

9 / 48

## Dynamic programming – Problem Formulation

- Optimal control problem

$$\min J(u) = \phi(x(t_b), t_b) + \int_{t_a}^{t_b} L(x(t), u(t), t) dt$$

$$\text{s.t. } \frac{d}{dt} x = f(x(t), u(t), t)$$

$$x(t_a) = x_a$$

$$u(t) \in U(t)$$

$$x(t) \in X(t)$$

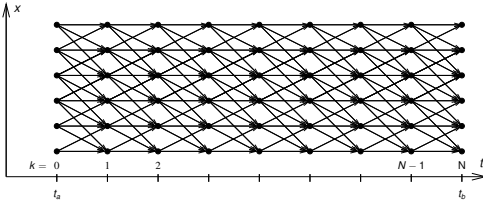

- $x(t)$ ,  $u(t)$  functions on  $t \in [t_a, t_b]$
- Search an approximation to the solution by discretizing
  - the state space  $x(t)$
  - and maybe the control signal  $u(t)$
 in both amplitude and time.
- The result is a combinatorial (network) problem

$$J(x_0) = g_N(x_N) + \sum_{k=0}^{N-1} g_k(x_k, u_k)$$

$$x_{k+1} = f_k(x_k, u_k)$$

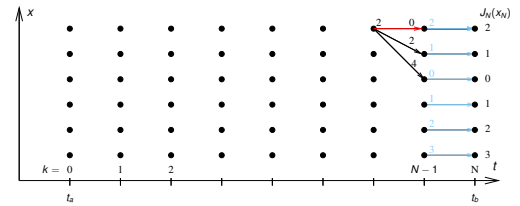

Algorithm idea:

Start at the end and proceed backwards in time to evaluate the optimal cost-to-go and the corresponding control signal.

10/48

Graphical illustration of the solution procedure

11/48

## Arc Cost Calculations

There are two ways for calculating the arc costs

- Calculate the exact control signal and cost for each arc.
  - Quasi-static approach
- Make a grid over the control signal and interpolate the cost for each arc.
  - Forward calculation approach

Matlab implementation – it is important to utilize matrix calculations

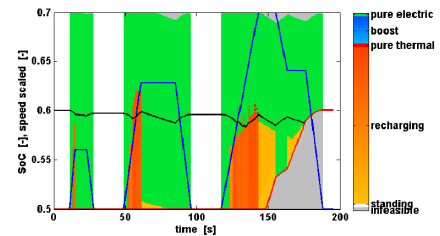

- Calculate the whole bundle of arcs in one step
- Add boundary and constraint checks

2D and 3D grid examples on whiteboard

12/48

## Parallel Hybrid Example

- Fuel-optimal torque split factor  $u(SOC, t) = \frac{T_{g-motor}}{T_{gearbox}}$
- ECE cycle
- Constraints  $SOC(t = t_f) \geq 0.6$ ,  $SOC \in [0.5, 0.7]$

14/48

## Examples of Short Term Storage Systems

15/48

## Short Term Storage – F1

2009 FIA allowed the usage of 60 kW, KERS (Kinetic Energy Recovery System) in F1.

Technologies:

- Flywheel
- Super-Caps, Ultra-Caps
- Batteries

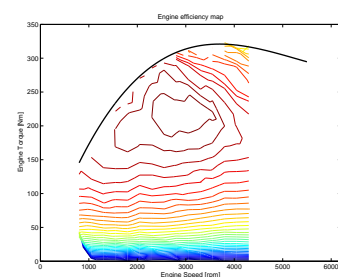

2014, will allow KERS units with 120 kilowatts (160 bhp).

–To balance the sport's move from 2.4 l V8 engines to 1.6 l V6 engines.

16/48

## Basic Principles for Hybrid Systems

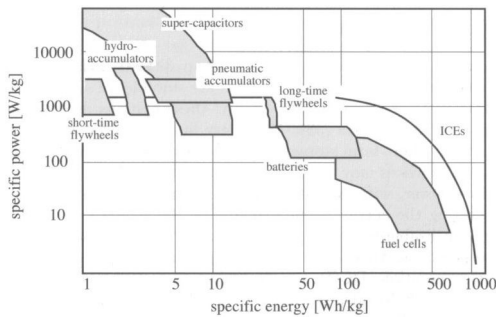

- Kinetic energy recovery
- Use “best” points – Duty cycle.
  - Run engine (fuel converter) at its optimal point.
  - Shut-off the engine.

17/48

## Power and Energy Densities

### Asymptotic power and energy density – The Principle

19 / 48

## Causality for a hybrid-inertial propulsion system

20 / 48

## Flywheel accumulator

► Energy stored ( $\Theta_f = J_f$ ):

$$E_f = \frac{1}{2} \Theta_f \omega_f^2$$

► Wheel inertia

$$\Theta_f = \rho b \int_{Area} r^2 2\pi r dr = \dots = \frac{\pi}{2} \rho b \frac{d^4}{16} (1 - q^4)$$

21 / 48

## Flywheel accumulator – Design principle

► Energy stored (SOC):

$$E_f = \frac{1}{2} \Theta_f \omega_f^2$$

► Wheel inertia

$$\Theta_f = \rho b \int_{Area} r^2 2\pi r dr = \dots = \frac{\pi}{2} \rho b \frac{d^4}{16} (1 - q^4)$$

► Wheel Mass

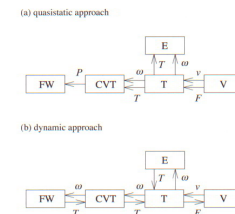

$$m_f = \pi \rho b d^2 (1 - q^2)$$

► Energy to mass ratio

$$\frac{E_f}{m_f} = \frac{d^2}{16} (1 + q^2) \omega_f^2 = \frac{v^2}{4} (1 + q^2)$$

22 / 48

## Quasistatic Modeling of FW Accumulators

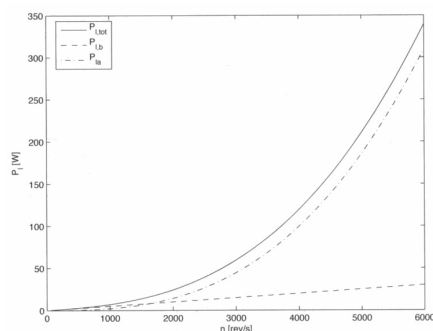

Flywheel speed (SOC)  $P_2(t)$  – power out,  $P_1(t)$  – power loss

$$\Theta_f \omega_2(t) \frac{d}{dt} \omega_2(t) = -P_2(t) - P_1(t)$$

23 / 48

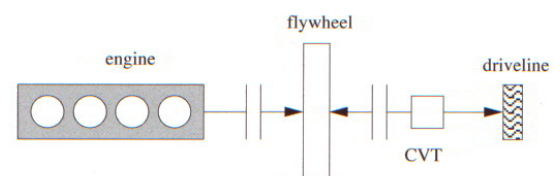

## Power losses as a function of speed

### Air resistance and bearing losses

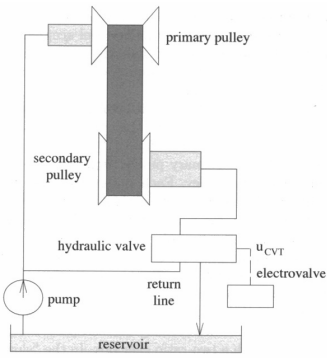

24 / 48

## Continuously Variable Transmission (CVT)

25 / 48

## CVT Principle

26 / 48

## CVT Modeling

- Transmission (gear) ratio  $\nu$ , speeds and transmitted torques

$$\omega_1(t) = \nu(t) \omega_2(t)$$

$$T_{H1}(t) = \nu(T_{H2}(t) - T_I(t))$$

- Newtons second law for the two pulleys

$$\Theta_1 \frac{d}{dt} \omega_1(t) = T_1(t) - T_{H1}(t)$$

$$\Theta_2 \frac{d}{dt} \omega_2(t) = T_2(t) - T_{H2}(t)$$

- System of equations give

$$T_1(t) = T_I(t) + \frac{T_2(t)}{\nu(t)} + \frac{\Theta_{CVT}(t)}{\nu(t)} \frac{d}{dt} \omega_2(t) + \Theta_1 \frac{d}{dt} \nu(t) \omega_2(t)$$

27 / 48

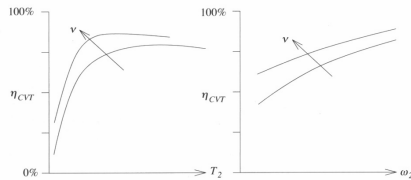

## CVT Modeling

- Transmission (gear) ratio  $\nu$ , speeds and transmitted torques

$$\omega_1(t) = \nu(t) \omega_2(t)$$

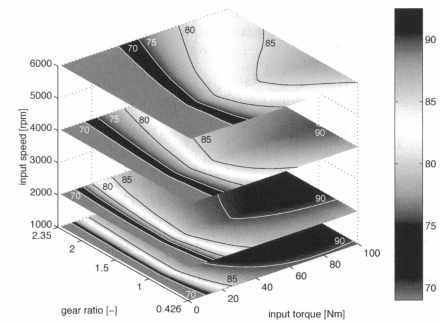

$$T_{H1}(t) = \nu(T_{H2}(t) - T_I(t))$$

- An alternative to model the losses, is to use an efficiency definition.

30 / 48

31 / 48

## Causality for a hybrid-hydraulic propulsion system

32 / 48

## Modeling of a Hydraulic Accumulator

Modeling principle

–Energy balance

$$m_g c_v \frac{d}{dt} \theta_g(t) = -p \frac{d}{dt} V_g(t) - h A_w (\theta_g(t) - \theta)$$

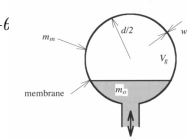

–Mass balance

(=volume for incompressible fluid)

$$\frac{d}{dt} V_g(t) = Q_2(t)$$

–Ideal gas law

$$p_g(t) = \frac{m_g R_g \theta_g(t)}{V_g(t)}$$

Power generation

$$P_2(t) = p_2(t) Q_2(t)$$

33 / 48

## Model Simplification

Simplifications made in thermodynamic equations to get a simple state equation.

- ▶ Assuming steady state conditions.
  - Eliminating  $\theta_g$  and the volume change gives

$$p_2(t) = \frac{h A_w \theta_w m_g R_g}{V_g(t) h A_w + m_g R_g Q_2(t)}$$

- ▶ Combining this with the power output gives

$$Q_2(t) = \frac{V_g(t)}{m_g} \frac{h A_w P_2(t)}{R_g \theta_w h A_w - R_g P_2(t)}$$

- ▶ Integrating  $Q_2(t)$  gives  $V_g$  as the state in the model.
- ▶ Modeling of the hydraulic systems efficiency, see the book.
- ▶ **A detail for the assignment**
  - This simplification can give problems in the simulation if parameter values are off. (Division by zero.)

35/48

## Hydraulic Pumps

36/48

## Modeling of Hydraulic Motors

- ▶ Efficiency modeling

$$P_1(t) = \frac{P_2(t)}{\eta_{hm}(\omega_2(t), T_2(t))}, \quad P_2(t) > 0$$

$$P_1(t) = P_2(t) \eta_{hm}(\omega_2(t), -|T_2(t)|), \quad P_2(t) < 0$$

- ▶ Willans line modeling, describing the loss

$$P_1(t) = \frac{P_2(t) + P_0}{e}$$

- ▶ Physical modeling
  - Wilson's approach provided in the book.

Case Study 3: ICE and Flywheel Powertrain

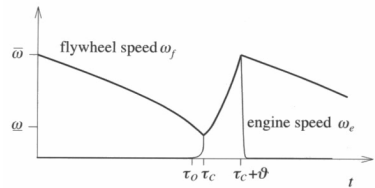

- Control of a ICE and Flywheel Powertrain
- Switching on and off engine

45 / 48

Problem description

For each constant vehicle speed find the optimal limits for starting and stopping the engine  
–Minimize fuel consumption

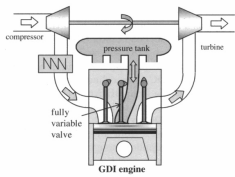

–Solved through parameter optimization  $\Rightarrow$  Map used for control

46 / 48

Case Study 8: Hybrid Pneumatic Engine

- Local optimization of the engine thermodynamic cycle
- Different modes to select between
- Dynamic programming of the mode selection

47 / 48
